

Hello World

**Definition 1.** *Integral domain is commutative Ring  $R$ , if  $a, b \in R$  and  $a, b \neq 0$  then  $ab \neq 0$*

**Definition 2.** *An integral domain is called Euclidean if there exists function  $f: R \setminus \{0\} \rightarrow \mathbb{N}$  satisfies the two properties:*

1.  $f(a) < f(ab)$  for all nonzero  $a, b \in R$

2.  $\forall a, b \in R$  with  $b \neq 0$ , there exists  $q, r$  such that  $a = q * b + r$  where  $f(r) < f(b)$
